

Convolutions and transposed convolutions

The most common ConvNet architecture follows the pattern:

INPUT \rightarrow $[(\text{CONV} \rightarrow \text{RELU})^N \rightarrow \text{POOL}]^M \rightarrow [\text{FC} \rightarrow \text{RELU}]^K \rightarrow \text{FC}$

Convolutions as matrix operations

Convolutions as matrix operations

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	4	1	0	1	4	3	0	3	3	1	0	0	0	0	0
1	0	1	4	1	0	1	4	3	0	3	3	1	0	0	0	0
2	0	0	0	0	1	4	1	0	1	4	3	0	3	3	1	0
3	0	0	0	0	0	1	4	1	0	1	4	3	0	3	3	1

Convolution Matrix (4, 16)

1	4	1
1	4	3
3	3	1

1	4	1	0	1	4	3	0	3	3	1	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

Convolutions as matrix operations

Upsampling

With the convolution matrix, we can go from 16 (4x4) to 4 (2x2) because the convolution matrix is 4x16.

**Then, if we have a 16x4 matrix, we can go from 4 (2x2) to 16 (4x4):
We can perform upsampling.**

Upsampling

Old fasion approaches (eg. `cv.resize()`):

- Nearest neighbor interpolation
- Bi-linear interpolation
- Bi-cubic interpolation

Transposed convolution
